Assignment 0 - Dog

Jake Armendariz - jsarmend@ucsc.edu = 1650932

How does the code for handling a file differ from that for handling standard input?

- The code will continue to run on standard input, taking in standard input and posting to file for every line submitted until ctrl-D is pressed, signalling the end of the file.

What concept is this an example of?

- Modularization. I have different modules and plans for each instance I have to handle, user input, or files.

Testing:

- I tested my code by comparing files with cat. I tried images, text files, user input (in different orders)

Conclusion

- This project taught me how to use open, read, write with C. Didn't learn too much about abstraction or any other topic covered, but I think I have a better grasp of C :).
